

## Combination Sum

Given an array of **distinct** integers candidates and a target integer target, return *a list of all **unique combinations** of candidates where the chosen numbers sum to target*. You may return the combinations in **any order**.

The **same** number may be chosen from candidates an **unlimited number of times**. Two combinations are unique if the

frequency

of at least one of the chosen numbers is different.

The test cases are generated such that the number of unique combinations that sum up to target is less than 150 combinations for the given input.

### **Example 1:**

**Input:** candidates = [2,3,6,7], target = 7

**Output:** [[2,2,3],[7]]

### **Explanation:**

2 and 3 are candidates, and  $2 + 2 + 3 = 7$ . Note that 2 can be used multiple times.

7 is a candidate, and  $7 = 7$ .

These are the only two combinations.

### **Example 2:**

**Input:** candidates = [2,3,5], target = 8

**Output:** [[2,2,2,2],[2,3,3],[3,5]]

### **Example 3:**

**Input:** candidates = [2], target = 1

**Output:** []

### **Constraints:**

- $1 \leq \text{candidates.length} \leq 30$
- $2 \leq \text{candidates}[i] \leq 40$
- All elements of candidates are **distinct**.
- $1 \leq \text{target} \leq 40$
